Performance evaluation standards

Fish tissue, soil, and sediment reference materials

In May of 2003 an announcement was sent to Environmental laboratories around the world for a new interlaboratory study conducted by CIL and Cerilliant. The purpose of this study was to characterize dioxin, PCB, pesticide, and other organic contaminant levels in soil, sediment, and fish tissue reference materials.

The objectives of this interlaboratory study were to quantitate the levels of a wide variety of environmental contaminants in two new matrices: a sample taken from river sediment in an area known to have PCB contamination and a soil sample taken from a location where no known contamination had occurred. Additionally, the three Fish Performance Evaluation samples were re-evaluated with new consensus values added to the existing consensus values. The existing analyte list has been expanded to include additional dioxins, furans, and PCBs. Additionally, other analyte groups such as Brominated Flame Retardants, Polyaromatic Hydrocarbons, Pesticides, and other Priority Pollutants have had consensus values obtained.

Fly ash reference material

In 2007, Cambridge Isotope Laboratories performed an international interlaboratory study on Fly Ash Reference Material purchased from Consorzio INCA in Italy. The ash comes from the filter of a municipal waste incinerator in northern Italy, and has been analyzed and given consensus values for numerous dioxin, furan, and PCB congeners. This sample is meant to be used to evaluate the performance of an analytical laboratory for the analytes given.

¹ Assigned value as determined by Manna Associates in the UK using Cofino analysis of raw interlaboratory study data.						
² Reference value is the Assigned Value plus or minus two standard deviations. Negative numbers resulting from two standard deviations being greater than the assigned value have no significance.						
³ Number of laboratories providing results for this analyte.						
⁴ All numbers in parentheses refer to the IUPAC designation for the compound.						

Cod liver oil reference materials

In 2010, Cambridge Isotope Laboratories organized an international interlaboratory study on Cod Liver Oil Reference Materials purchased from TestAmerica Laboratories in TN, USA. Commercially available Cod Liver Oil was spiked with known amounts of Dioxins, Furans, and PCBs for the Fortified Cod Liver Oil reference material. A separate standard with no spike was also prepared as a blank. These samples are meant to be used to evaluate the performance of an analytical laboratory for the analytes given.

PCB standards and standard mixtures

Unlabelled “Certified” PCB Standards

While CIL's primary business is isotopically labelled standards, it is important to remember that the accuracy and precision of a quantitative analysis is dependent upon the accuracy and precision of the unlabelled (native) standards. In the past, CIL utilized commercially available native standards from multiple vendors for the confirmation of our isotopically labelled standards. It was discovered, however, that there can be substantial variability among the commercial native standards. Thus CIL initiated the “Certified” PCB standards program. CIL prepares native “Certified” standards using good laboratory practice (GLP). Individual, native, crystalline PCB isomers (98%+ purity) are weighed in triplicate on a microbalance calibrated with NIST traceable Class S weights, and formulated to specific concentration. Triplicate analyses of each of the three solutions in isooctane are carried out using GC/MS. In order to establish statistical control, the relative standard deviation (RSD) of each solution must be less than 5%, and the RSD for the entire set of analyses for all three standards must be <5%. When these parameters have been met, the solutions are combined and the resulting solution analyzed again in triplicate by three chemists. If the RSD of these analyses is also <5%, the final product is the “Certified” PCB standard. These 100 µg/mL solutions are highly accurate native standards for quantitation of PCBs. These standards are used in all CIL calibration series and native standard mixtures, and are used to validate all isotope labelled standards from CIL.

Isotope Labelled PCB Standards

CIL now offers more than 50 individual ¹³C-labelled PCB standards to meet the growing needs of researchers utilizing Isotope Dilution MS. All ¹³C-labelled PCB standards are quantified against CIL “Certified” unlabelled PCB standards for utmost precision and accuracy.

In addition to the “Dioxin-Like” (DL) congeners designated by the WHO, CIL also offers standards for the “non-Dioxin-Like” or “Marker” PCB congeners found in commercial mixtures, as well as a host of other ¹³C-labelled PCB standards used for specialized purposes.

NEW “High Purity” PCB Standards

For more than 20 years CIL has been a pioneer in developing high quality PCB standards, introducing the first ¹³C-labelled PCBs used in the earliest IDMS methods, and more recently developing the first PCB standards formulated under the “Certified Standards” protocol. CIL is once again responding to the needs of the analytical community by providing High Purity PCB standards. As new instrumentation and methodologies drive detection limits lower, the presence of even very low levels of impurities in the labelled standards of other PCB congeners or polychlorinated dibenzo-p-dioxins and dibenzofurans (PCDD/Fs), become a hindrance to the laboratories minimum detection capabilities. CIL has developed aggressive cleanup procedures, and adopted much tighter quality control specifications for the eight mono-ortho substituted “dioxin-like” PCBs (DL-PCBs). These new specifications include extremely low allowances for ¹³C-non-ortho DL-PCBs, native content, other PCB congeners and PCDD/Fs.

Chemical Identity: Unambiguous identity by GC/MS, ¹H-NMR, ¹³C-NMR, and MP determination

Isotopic Enrichment: 99% by GC/MS

Chemical Purity: >98% by GC/MS, GC/ECD, and ¹H-NMR

- Native Content: <0.1% by GC/MS SI
- ¹³C-non-ortho DL-PCBs: <0.05% by GC/ECD vs. cal-curve, or HRGC/MS
- 17 (2,3,7,8) Containing PCDD/Fs: <0.05% for each compound by HRGC/MS

Concentration: 40 ± 2 µg/mL by comparison assay vs. native “Certified Standard”

Uncertainty: Conforming to Eurachem/CITAC Guide “Quantifying Uncertainty in Analytical Measurement”

CEN Method EN-1948-4 PCB Standard Mixtures

In 2006, CIL collaborated with the CEN (European Committee for Standardization) organizing laboratory to develop and define PCB Calibration series and ¹³C₁₂-labelled spiking solutions to be used with method CEN / TS 1948-4. CIL supplied these standards to the organizing laboratory for use in their Interlaboratory Evaluation Study, and now these same standards are available to you from CIL.

NEW Comprehensive Native PCB Mixtures

CIL has produced two large mixes of unlabelled PCBs, formulated entirely from CIL's PCB “Certified Standards” individual stock solutions. The Comprehensive Native PCB Mixture is a multipurpose mixture that includes all the WHO Dioxin-Like PCBs that have been assigned TEFs, the predominant congeners, and first- and last-eluting congeners from the Mono through Deca homologue groups. Since some pairs of these compounds coelute on certain columns, the Fully Resolved Native Mono-Deca PCB Mixture was formulated with no coeluting congeners under normal analytical conditions.

NEW Mixed Bromo/Chloro Biphenyl Standards

CIL now offers a selection of labelled and unlabelled mixed halogenated biphenyl standards and standard mixtures. While very limited research has been done to date, these compounds have been identified in environmental matrices, and warrant further investigation.

Unlabelled mixed bromo/chloro PCB standards

Mixed bromo/chloro biphenyls are thought to be produced by incinerator combustion and as by-products of BDE production. CIL has started a programme to synthesise this class of compounds to assist researchers in initial studies in this field.

Brominated flame retardant standards

Isotope Labelled Brominated Diphenyl Ether (BDE) Standards

Generally used as flame retardants, Brominated Diphenyl Ethers (BDEs) have become chemicals of significant environmental concern. BDEs may be generally considered as persistent and highly lipophilic substances, similar to well known environmental contaminants such as polychlorinated biphenyls (PCBs).

In 1996, Cambridge Isotope Laboratories (CIL) first introduced Chlorinated and Brominated Diphenyl Ether analytical standards. Since then, additional studies in Europe, Canada, Japan, and the United States have significantly increased interest in these products and enabled CIL to extend its flame-retardant offerings.

U.S. EPA Method 1614 Standard Mixtures

The United States EPA has developed a standardized test method for analysis of Brominated Diphenyl Ethers in multiple matrices by High Resolution GC / MS. CIL worked closely with the EPA and their contracting laboratories to develop standard mixtures specifically for use in Method 1614.

RoHS BDE Standard Mixtures

The Directive on the Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment (2002 / 95 /EC), commonly referred to as the Restriction of Hazardous Substances Directive (RoHS) was adopted in February 2003 in Europe and took effect in July 2006. This directive restricts the use of several types of hazardous materials in the manufacture of various types of electronic and electrical equipment. CIL worked with laboratories in the European Union to develop standards for analysis of brominated diphenyl ethers under the RoHS guidelines.

Brominated Flame Retardant Standards and Standard Mixtures

Following regulatory restrictions and voluntary removal of Brominated Diphenyl Ether (BDE) products from many flame retardant applications, new brominated compounds have been developed as replacements for BDEs. As monitoring of these possible environmental pollutants increased, CIL developed several labelled and unlabelled standards to allow accurate analysis of these new-use Brominated Flame Retardant (BFR) compounds. CIL further developed a series of standard mixtures which include a combination of BDEs and other BFRs in comprehensive mixtures.

Isotope labelled and unlabelled BDE Metabolites

Researchers have suggested that BDE body burdens are not completely represented by measurements of BDEs in tissue or milk.

Analytical data indicates that the liver hydrolyzes BDEs in its attempts to expel them. BDE toxicity is still being established, but there is a likelihood that BDE metabolites have similar or greater toxicity than the parent BDEs. CIL has been producing both unlabelled and $^{13}\text{C}_{12}$ Methoxy- and Hydroxy-BDEs. These items represent some of the BDE metabolites available from CIL; please contact LGC Standards for more information on these compounds.

RoHS standards

From 1st July 2006 the use of Pb, Cd, Hg, Cr(VI) and certain polybrominated flame retardants in electric and electronic devices will be banned unless no technical substitute exists. This is a requirement of the Directive 2002/95/EC on the "Reduction of the use of certain hazardous substances in electrical and electronic equipment" (RoHS) and currently limit values of 1 g/kg (0.1 %) are being discussed.

Polycyclic aromatic hydrocarbons (PAH)

Carbon-13 labelled polycyclic aromatic hydrocarbons (PAH) standards

Cambridge Isotope Laboratories, in cooperation with Cerilliant Corporation, is pleased to offer ¹³C-labeled Polycyclic Aromatic Hydrocarbons (PAHs), as a superior alternative to deuterated standards. Although CIL has traditionally produced high-quality deuterated PAH analogs, some analysts have observed back-exchange of proton for deuterium under harsh extraction conditions and in certain matrices. If precise quantitation is required, or complete recovery information is needed, the non-exchangeable ¹³C isotope label is the right standard to use.

Deuterium Back-Exchange

While analysts have been using Deuterated PAH standards for years, labile deuterons are susceptible to back-exchange. The phenomenon is particularly likely to occur in acidic or catalytic matrices, when the importance of a reliable internal standard is greatest.

Deuterium-labeled PAH Metabolites are even more susceptible to the phenomena of back-exchange and loss of protons /deuterons in the mass spectrometer

ISO Accreditation

Adding to our list of firsts in the field of PAH reference standards, CIL is pleased to announce the availability of the first ¹³C PAH parent compound standards manufactured under ISO/ IEC 17025 and ISO Guide 34 accreditation.

Cerilliant Corporation, CIL's longtime collaborator for ¹³C PAH standards, has received accreditation under ISO Guide 34 for Reference Material Producers, as well as ISO/IEC 17025 for Testing and Calibration Laboratories.

Substituted benzothiophenes

Substituted dibenzothiophenes, sulfur analogues of the chlorinated dibenzofurans, are of interest to analysts due to their remarkable similarities to the chlorinated dioxin class of compounds. A very high mass resolution is necessary to distinguish a chlorinated dibenzothiophene from a chlorinated dioxin. This fact, coupled with the lack of commercially available pure isomers of these sulfur-containing compounds, has led to some speculation that in certain cases, compounds being quantitated as dioxins were, in reality, dibenzothiophenes.

Priority pollutant standard mixtures

Chlorobenzene and Chlorophenol Standard Mixtures

Owing to the sheer volume of use in commercial products, Halogenated Benzenes and Phenols remain among the largest contributors to environmental contamination. The standards listed here are in routine use in many laboratories around the world.

U.S. EPA Method 1653a

U.S EPA method 1653A is used for the determination of Pollutants in Pulp and Paper industry wastewater. This revision was promulgated in 1997, superseding the earlier method 1653. While still used primarily for the determination of Chlorophenolic compounds, Revision A incorporates several changes to the analytical procedure, including the use of specially formulated standard mixtures applicable to this revision.

U.S. EPA CIP DMC Standard Mixtures

EPA's Contract Laboratory Program (CLP) has developed methods for the analysis of volatile and semi-volatile compounds which utilize isotopically labelled internal standards. These Deuterated Monitoring Compounds (DMCs) have been added to strengthen the analysis by providing sample-by-sample internal standard addition. CIL's CLP DMC standard mixtures are designed to match requirements of the OLC and SOM test methods.

U.S. EPA Method 1624/1625

CIL maintains a full suite of standards used for the analysis of volatile and semi-volatile organic compounds by US EPA Method 1624/1625.

Priority pollutants, endocrine disruptor and chemical contaminant standards

Pharmaceutical and Personal Care Product (PPCP) Standards

Concern about environmental and human exposure to Pharmaceuticals and Personal Care Products (PPCPs) has grown significantly.

This classification encompasses a broad range of chemicals, ranging from antibiotics to hormones to pesticides. One common theme among these groups is the need for high-quality isotopically labelled standards to strengthen the analysis of PPCPs in difficult matrices such as sewage sludge and wastewater. CIL, with guidance from leading laboratories around the world, has been working diligently to produce representative standards for the analysis of PPCPs.

Food and Drinking Water analysis Standards

Increased attention to possible contamination of food and water has caused analysts to broaden the scope of trace food and water testing by Isotope Dilution Mass Spectrometry. Of particular interest are veterinary antibiotics used to improve the health of feed animals, ranging from shrimp to poultry to cattle. Human antibiotics, pharmaceuticals, and hormones that are not removed during wastewater treatment are also of interest, as is the routine analysis of POPs, pesticides, and other industrial contaminants that have entered the food and water supply.

Phthalate and Phthalate Metabolite Standards

Phthalates continue to be a growing environmental concern, especially as more is learned about the effect of continued exposure on the environment and the human body. Phthalate diesters are ubiquitous in the laboratory environment, so many analysts are now examining phthalate monoesters and metabolites of phthalate monoesters to reduce background interferences.

Adipate esters are also anticipated to be of interest to exposure analysts; please inquire if you are interested in additional adipate standards.

Perfluorinated Compound (PFC) Standards

From stain-resistant textiles to non-stick surface coatings and much more, Poly- and Perfluorinated compounds (PFCs) are nearly ubiquitous chemicals in the environment. CIL offers several new labelled and unlabelled Perfluorinated Carboxylic Acid standards (PFCAs) in this catalog. CIL will be continuously adding to our offerings, so we recommend visiting our website for product updates in this rapidly growing field

Nitrosamine Standards

Nitrosamine compounds are contaminants that may be found in food and tobacco products, and some have been classified as carcinogenic. While efforts have been made to reduce the levels of nitrosamines in commercial products, the need to monitor trace levels of this pollutant has prompted CIL to expand our offerings of labelled and unlabelled Nitrosamine standards.

Endocrine Disrupting Compounds and Xenoestrogen Standards

CIL is committed to supporting the analysis of Endocrine Disrupting Compounds (EDCs) using Isotope Dilution Mass Spectrometry. If you require an EDC not listed, please contact us to discuss preparation.

Halogenated and Substituted Benzene and Phenol Standards

Many industrial and consumer products are composed of chemicals that contain halogenated or substituted benzene or phenol functional groups. Resistant to decomposition and metabolism, these chemicals may persist even after the parent molecule has undergone partial decomposition, or they may exist as a product or an industrial byproduct. The increased use of brominated compounds is expected to lead to more brominated benzenes and phenols in the environment, and the continued presence of chlorinated compounds ensures that chlorinated benzenes and phenols will be found in the environment for years to come.

Phthalate & phthalate metabolite standards

Phthalates are emerging as a growing environmental concern, especially as more is learned about the effect of continued exposure on the environment and the human body. Phthalate diesters are ubiquitous in the laboratory environment, so many analysts are now examining phthalate monoesters and metabolites of phthalate monoesters to reduce background interferences. Adipate esters are also anticipated to be of interest to exposure analysts and additional adipate standards are expected to be made available.

Halogenated and substituted benzene and phenol standards

Many industrial and consumer products are composed of chemicals that contain halogenated or substituted benzene, or phenol functional groups. Resistant to decomposition and metabolism, these chemicals may persist even after the parent molecule has undergone partial decomposition, or they may exist as a product or industrial byproduct. The increased use of brominated compounds is expected to lead to more brominated benzenes and phenols in the environment, and the continued presence of chlorinated compounds ensures that chlorinated benzenes and phenols will be found in the environment for years to come.

Pesticide Standards

CIL continues to add to our already extensive inventory of isotopically labeled standards for pesticide and pesticide metabolite analysis. As a result of this development over the past few years, we can now present our standards by category, including: Organochlorine, Organophosphorous, Carbamate, Triazine, or Pyrethroid pesticide standards. You can still find our complete listing as well if you wish to scan through the comprehensive array of standards.

Chlorinated Cyclodiene Pesticide Standards

Chlorinated Cyclodiene Pesticides account for seven of the compounds governed by the Stockholm Convention. While production and use of these compounds is stringently regulated if not banned outright, their widespread use for decades and persistence in the environment ensures their presence in the environment and biota for years to come. CIL offers a comprehensive selection of the individual standards, as well as a growing list of convenient mixes.

Organochlorine Pesticide Standards

Organochlorinated Pesticides, like Chlorinated Cyclodiene Pesticides, are heavily represented in the list of compounds governed by the Stockholm Convention. Also like Chlorinated Cyclodiene Pesticides, their widespread use for decades and persistence in the environment ensures their presence in the environment and biota for years to come. Organophosphate (OP), Pyrethroid and Carbamate Pesticides As man's quest for less toxic (to larger species) and less environmentally persistent pesticides expands, the need for new testing has expanded as well. CIL continues to prepare and provide standards for the analysis of alternative and minor pesticides and herbicides.

Triazine Herbicide and Metabolite Standards

Atrazine is one of the most widely used herbicides in the world. In recent years, studies on the correlation of physical and reproductive disorders in frogs with Atrazine exposure have been a controversial topic. With CIL's comprehensive collection of carefully purified and prepared standards of Atrazine and its many metabolites, researchers should have some powerful tools to refine their investigations.

Toxaphene Standards

CIL has put considerable effort into developing the first set of ¹³C-labeled Toxaphene standards! Listed by Parlar congener#, our labeled and unlabeled standard offerings continue to grow, so keep an eye on our website and future product announcements for more details. Our new POPs Toxaphene mixtures are ideal for researchers interested in primary investigations of the most prevalent congeners.

Pesticide Standard Mixtures

New applications and increased testing by Isotope Dilution MS have led to the development of several new pesticides mixtures being offered for the first time in this catalog. Our new Expanded POPs pesticide calibration series and related spiking mixtures contain all pesticides listed as Stockholm Convention POPs compounds, including the recently added Kepone (aka Chlordane), HCHs (including Lindane), Pentachlorobenzene, and Endosulfan I and II. These new solutions allow analysts to use preformulated mixtures for detection and quantification of the complete series of these important POPs compounds.

Chemical Weapon Metabolite Standards

Often quite similar to metabolites of common pesticides, Chemical Weapons metabolite standards assist researchers determine potential contamination from dangerous compounds such as nerve agents and other toxic chemicals. Several metabolites, degradation byproducts and more are represented in this section.

ULTRAcheck and standards for EPA methods

Excellence through measurement

Environmental standards from ULTRA Scientific

LGC Standards, in partnership with ULTRA Scientific®, recognised as a leading producer of environmental standards, now offers thousands of organic and inorganic standards covering all the major contaminants.

- Over 25 years of expertise
- ISO Guide 34 accreditation
- Expert local customer service and technical support
- Assistance in finding the right material to suit your needs
- Custom standards tailored to specific individual requirements

ULTRAccheck® blind, quality control check standards

ULTRAccheck® is a series of blind quality control standards used to check whether or not your analytical system is in control. ULTRAccheck® is designed to mimic real world samples for specific EPA methods and run as blind samples. The analytical data generated using the method is then compared to the true value supplied with the ULTRAccheck® standard. Agreement between the data generated for ULTRAccheck® used as a blind sample and the true value of the ULTRAccheck® standard indicated that the analytical system is in control.

Use ULTRAccheck® on a Regular Basis to:

Train Personnel
Establish and maintain EPA method proficiency
Verify analytical system accuracy and precision

ULTRAccheck® true values are provided in a separate, sealed envelope. Data obtained using the ULTRAccheck® blind sample can be immediately compared against true values supplied. Complete instructions are included with each sample.

EPA 500 Methods

Analysis of finished drinking waters and raw source water

The EPA 500 methods are designed to identify and quantify organic compounds in municipal drinking water. This series consists of twenty-nine methods for the detection of volatile organic compounds (VOCs), pesticides, and synthetic organic compounds (SOC). These methods are cited under the Safe Drinking Water Act (SDWA).

ULTRA Scientific has prepared a series of VOC, pesticide, and SOC reference standards for the 500 series methods as well as the necessary surrogate and internal standards. Each analyte in a reference standard is pre-analysed, with most analytes being >99% pure. All solvents are of the highest quality available. All solutions are gravimetrically prepared to a precision of $\pm 0.5\%$. A certificate showing the actual weights used is supplied with each mixture.

EPA Method 501

Trihalomethanes in drinking waters

Method 501 is a purge and trap method for measurements of total trihalomethanes using GC/ECD. These standards may be used for methods 501.1, 501.2, and 501.3.

EPA Method 502.2

Volatile organic compounds in water

Method 502.2 is an enhanced and expanded version 502.1. It is a purge and trap GC method, but uses a capillary column to effect a more efficient separation. Detection is carried out using a photoionization detector in series with either an electrolytic conductivity or microcoulometric detector, allowing determination of all sixty analytes of interest.

EPA 600 Methods

Analysis of organic compounds in industrial and municipal waste water discharges.

The 600 series methods are designed for monitoring organic pollutants in industrial and municipal discharges under the Clean Water Act.

ULTRA Scientific has prepared a series reference standards for the 60 series methods as well as the necessary surrogate and internal standards. Each analyte in a reference standard is pre-analysed, with most analytes being >99% pure. All solvents are of the highest quality available. All solutions are gravimetrically prepared to a precision of ±0.5%. A certificate showing the actual weights used is supplied with each mixture.

Petroleum Hydrocarbons Method 1664 is a gravimetric method allowing determination of n-hexane extractable material (HEM) in surface and saline waters, and in industrial and domestic aqueous wastes. Extractable materials that may be determined are relatively non-volatile hydrocarbons, vegetable oils, animal fats, waxes, soaps, greases, and related materials.

EPA 8000 Methods

Reference materials for monitoring organic pollutants in ground water

The 8000 series are used for monitoring organic pollutants in ground water as prescribed in the Resource Conservation and Recovery Act.

ULTRA Scientific has prepared a series reference standards for the 8000 series methods as well as the necessary surrogate and internal standards. Each component in a reference standard is pre-analysed, with most analytes being >99% pure. All solvents are of the highest quality available. All solutions are gravimetrically prepared to a precision of ±0.5%. A certificate showing the actual weights used is supplied with each mixture.

EPA Methods 8280B & 8290A

Polychlorinated dibenzo-p-dioxins (PCDDs) and polychlorinated dibenzofurans (PCDFs)

EPA Methods 8280B and 8290A are high resolution GC methods. Method 8280B uses low-resolution mass spectrometry for detection (HRGC/LRMS), while 8290A uses high-resolution mass spectrometry (HRGC/HRMS) to quantitate the compounds of interest.

Benzonitrile (as N) kit (low)

New	U-PANAL0237	Benzonitrile (as N) kit (low)	4 x 2 mL
Each kit contains:			
Description .		Concentration	
Ampoule 1.... Toluene.....		Solvent blank	
Ampoule 2.... Benzonitrile (as N) in Toluene		1 mg/L	
Ampoule 3.... Benzonitrile (as N) in Toluene		5 mg/L	
Ampoule 4.... Benzonitrile (as N) in Toluene		10 mg/L	

Benzonitrile (as N) kit (high)

New	U-PANAL0238	Benzonitrile (as N) kit (high)	4 x 2 mL
Each kit contains:			
Description .		Concentration	
Ampoule 1.... Benzonitrile (as N) in Toluene		100 mg/L	
Ampoule 2.... Benzonitrile (as N) in Toluene		200 mg/L	
Ampoule 3.... Benzonitrile (as N) in Toluene		500 mg/L	
Ampoule 4.... Benzonitrile (as N) in Toluene		1000 mg/L	

Ultra low nitrogen Standards

New	U-PANAL0228	Ultra low nitrogen standard kit	6 x 2 mL
Each kit contains:			
Description .		Concentration	
Ampoule 1.... Toluene.....		Solvent blank	
Ampoule 2.... Pyridine (as N) in Toluene		50 µg/L	
Ampoule 3.... Pyridine (as N) in Toluene		100 µg/L	
Ampoule 4.... Pyridine (as N) in Toluene		200 µg/L	
Ampoule 5.... Pyridine (as N) in Toluene		500 µg/L	
Ampoule 6.... Pyridine (as N) in Toluene		1000 µg/L	
New	U-PANAL0228-1	Toluene (blank)	2 mL
New	U-PANAL0228-2	Pyridine (as N) - 50 µg/L in Toluene	2 mL
New	U-PANAL0228-3	Pyridine (as N) - 100 µg/L in Toluene	2 mL
New	U-PANAL0228-4	Pyridine (as N) - 200 µg/L in Toluene	2 mL
New	U-PANAL0228-5	Pyridine (as N) - 500 µg/L in Toluene	2 mL
New	U-PANAL0228-6	Pyridine (as N) - 1000 µg/L in Toluene	2 mL

Total nitrogen (TN) water applications standards kit (low)

New	U-PANAL0225	Ammonium sulfate (as N) + Sodium nitrate (as N) - kit	6 x 10 mL
Each kit contains:			
Description .		Concentration	
Ampoule 1 Water		Solvent blank	
Ampoule 2 Ammonium sulfate (as N) in Water		0.5 mg/L	
Sodium nitrate (as N) in Water		0.5 mg/L	
Ampoule 3 Ammonium sulfate (as N) in Water		1.0 mg/L	
Sodium nitrate (as N) in Water		1.0 mg/L	
Ampoule 4 Ammonium sulfate (as N) in Water		2.5 mg/L	
Sodium nitrate (as N) in Water		2.5 mg/L	
Ampoule 5 Ammonium sulfate (as N) in Water		5.0 mg/L	
Sodium nitrate (as N) in Water		5.0 mg/L	
Ampoule 6 Ammonium sulfate (as N) in Water		12.5 mg/L	
Sodium nitrate (as N) in Water		12.5 mg/L	

Total nitrogen (TN) water applications standards kit (medium)

New	U-PANAL0226	Ammonium sulfate (as N) + Sodium nitrate (as N) - kit	6 x 10 mL
Each kit contains:			
Description .		Concentration	
Ampoule 1 Water		Solvent blank	
Ampoule 2 Ammonium sulfate (as N) in Water		5.0 mg/L	
Sodium nitrate (as N) in Water		5.0 mg/L	
Ampoule 3 Ammonium sulfate (as N) in Water		12.05 mg/L	
Sodium nitrate (as N) in Water		12.5 mg/L	
Ampoule 4 Ammonium sulfate (as N) in Water		25.0 mg/L	
Sodium nitrate (as N) in Water		25.0 mg/L	
Ampoule 5 Ammonium sulfate (as N) in Water		37.5 mg/L	
Sodium nitrate (as N) in Water		37.5 mg/L	
Ampoule 6 Ammonium sulfate (as N) in Water		50.0 mg/L	
Sodium nitrate (as N) in Water		50.0 mg/L

ASTM D4929 (B) organic chloride in crude oil

New	U-PANAL0223	ASTM D4929 (B) Organic chloride in crude Oil Kit	6 x 2 mL
Each kit contains:			
Description .		Concentration	
Ampoule 1 ... Isooctane		Solvent blank	
Ampoule 2 ... Chlorobenzene (as Cl) in Isooctane		5 mg/L	
Ampoule 3 ... Chlorobenzene (as Cl) in Isooctane		10 mg/L	
Ampoule 4 ... Chlorobenzene (as Cl) in Isooctane		25 mg/L	
Ampoule 5 ... Chlorobenzene (as Cl) in Isooctane		50 mg/L	
Ampoule 6 ... Chlorobenzene (as Cl) in Isooctane		100 mg/L	

ASTM D5808 organic chlorine in hydrocarbons

New	U-PANAL0224	ASTM D5808 Organic chloride in hydrocarbons Kit	6 x 2 mL
Each kit contains:			
Description .		Concentration	
Ampoule 1 ... Methanol.....		Solvent blank	
Ampoule 2 ... Trichlorophenol (as Cl) in Isooctane.....		1 mg/L	
Ampoule 3 ... Trichlorophenol (as Cl) in Isooctane.....		5 mg/L	
Ampoule 4 ... Trichlorophenol (as Cl) in Isooctane.....		10 mg/L

Excellence through measurement

Phytochemical reference standards from ChromaDex

More than 2500 reference substances for phytochemical analysis

- Certified Reference Materials (CRM)
- Botanical Reference Materials (BRM)
- Extract Reference Materials (XRM)
- Standards with various documentation grades
- Reference standard kits
- Analytical methods

Reference standards for/from:

- Artichoke
- Belladonna
- Bilberry
- Black Cohosh
- Carotenoids
- Cat's Claw
- Devil's Claw

- Echinacea
- Ephedra
- Ginseng
- Kava Kava
- Reishi Mushroom
- Rosemary

Stoichiometry

	Code	Product	Unit
New	NIST-84L	Potassium hydrogen phthalate - Acidimetric value Certified purity.....99.9934% ± 0.0076%	60 g
	NIST-350b	Benzoic acid - Acidimetric value This Standard Reference Material® (SRM®) consists of highly purified benzoic acid (C ₆ H ₅ COOH). NIST-350b is intended for use in acidimetric standardization. The certified values are based on the results of determinations from 12 randomly selected bottles from the entire lot of NIST-350b. Each determination was obtained by coulometric acidimetric titration to the inflection point (pH ca. 8.15). W _{C₆H₅COOH} 9.9978 % ± 0.0044 % V _{H+} 188 40 mol kg ⁻¹ ± 0.000 26 mol kg ⁻¹	30 g
	NIST-973	Boric acid - Acidimetric standard This Standard Reference Material (SRM®) is certified as a chemical of known assay and is intended for use as a primary acidimetric standard. The SRM consists of highly purified boric acid (H ₃ BO ₃) in a 100 g bottle. W _{C₆H₅COOH} 100.009 % ± 0.010 %	100 g
	NIST-723d	2-Amino-2-(hydroxymethyl)-1,3-propanediol (THAM, Tris) - Acidimetric standard Certified value (mass fraction) for Tris, acidimetric assay Tris 99.924 % ± 0.036 %	50 g
	NIST-136f	Potassium dichromate - Oxidimetric value Certified purity..... 99.9954 %	60 g
	NIST-351a	Sodium carbonate - Acidimetric standard This Standard Reference Material (SRM®) is certified as a chemical of known assay and is intended for use as a primary acidimetric standard. The SRM consists of highly purified sodium carbonate (Na ₂ CO ₃) in a 50 g unit. Certified purity.....99.970 %	50 g
	NIST-987	Strontium carbonate - Assay/isotopic composition Certified values Purity.....99.98 % ⁸⁷ Sr 7.0015 % ⁸⁴ Sr.....0.5574 % ⁸⁶ Sr.....82.5845 % ⁸⁶ Sr 9.8566 %	1 g
	NIST-999b	Potassium chloride - Assay values Certified purity KCl 99.977 % K 52.4379 % Cl 47.5519 % Indicative values for Br, alkalinity	30 g
	NIST-RM 8040	Sodium oxalate - Reductometric This Reference Material (RM) was prepared to provide material of uniform, high purity for use as a working standard for oxidation-reduction reactions. Reference value Reductometric assay (mass fraction) 99.951 % ± 0.038 %	60 g
New	NIM-GBW06103B	Sodium chloride - Assay standard for chloride Certified value for purity is given	50 g
	NCS GC76210	Benzene Certified purity.....99.95 %	5 mL
New	NIM-GBW06106C	Potassium hydrogen phthalate - Purity Certified purity.....99.988 %	50 g
New	NIM-GBW06107C	Sodium oxalate Certified purity.....99.7 %	50 g
New	NIM-GBW06108A	Zinc oxide - Complexometric standard Certified value is given in the certificate	50 g
New	NIM-GBW06109A	Potassium chloride - Assay standard for chloride Certified values for Cl and K are given in the certificate	50 g
New	NIM-GBW06110C	Potassium iodate - Oxidimetry Certified purity.....99.97 % (as oxidation of potassium iodate)	50 g
New	NIM-GBW06105D	Potassium dichromate - Oxidimetry Certified purity.....99.979 % (as oxidation of potassium dichromate)	50 g

The Hg content of this natural isotopic spike is traceable to Hg amount content measurements based on gravimetry, whereby a mass of pure substance (Hg₂Cl₂) was weighed and corrections were made for impurities. ²⁾ Estimated expanded uncertainty U with a coverage factor k=2, corresponding to a level of confidence of about 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM), ISO, 1995. High purity inorganic chemicals

LGC Standards is committed to providing the highest-purity inorganic chemicals for the most demanding applications from MV Laboratories. Their core technology is the development and application of synthetic methods for the removal of trace impurities on the part-per-million range. They are able to do this without the use of zone refining, sublimation, or other techniques that typically add costs to the manufacturing process. This technology, combined with an expertise in inorganic synthesis, allows cost-effective production of hundreds of compounds with purities from 99.99% up to 99.9999%. As a global leader in the production of chemicals of ultra-high-purity inorganic chemicals for chemical analysis and synthesis, crystal growth, nanotechnology, special ceramics, and photonics research and development, MV Laboratories provides our customers with materials and services second to none. They remove trace impurities down to the sub-ppm range and employ the best quality control standards in the industry to guarantee the purity of their wide range of chemicals. Analytical documentation is created for each product test performed. MV Laboratories is dedicated to offering the most comprehensive certificate of analysis available on the market today.

Custom synthesis: MV Laboratories can prepare hundreds of inorganic materials, used in a variety of applications, in quantities ranging from a few gram to hundred of kilograms, including:

Hydrogen hexachloroplatinate, 99.999%	Fuel cell applications
Ammonium hexafluorotitanate, 99.99%	Nanotechnology

Reference nanomaterials from LGC Standards

LGC Standards has introduced a range of reference nanomaterials to aid research and testing into the applications and impacts of nanotechnology.

Nanomaterials are now used in a wide range of applications from food packaging and sunscreens to surface coatings and sports equipment. With the increasing presence of nanomaterials in new products, there has been a substantial increase in research into their manufacture, characterisation and applications and this has been matched by growth in demand for characterised reference materials

Master samples of the NM-series reference nanomaterials are stored in the nanomaterials repository of the European Commission's Joint Research Centre (JRC). The JRC distributes these master samples for use by EU Member States' authorities and in the OECD's Working Party on Manufactured Nanomaterials programme. The materials have been characterised using OECD recommended test methods and may serve as:

- Performance standard materials for testing and test method development
- Control materials for safety testing
- Testing materials for reference result and predictive toxicity testing

The series of reference nanomaterials have been selected based on their industrial and commercial importance and include:

Carbon nanotubes

Silver nanoparticles

Titanium dioxide

Cerium oxide

Zinc oxide

Silicon dioxide

New ERM-FD100	Colloidal silica in water - Particle size ERM-FD100 is a certified reference material and consists of colloidal silica nanoparticles suspended in a water-based solution. It is available in 10 mL pre-scored amber glass ampoules containing approximately 9 mL of suspension. The intended use is to check the performance of instruments and/or methods that characterise the particle size distribution of nanoparticles (particle size ranging from approximately 1 nm to approximately 100 nm) suspended in a liquid medium. Equivalent spherical diameter Certified value Uncertainty Intensity-weighted harmonic mean diameter ¹⁾ 19.0 nm 0.6 nm Intensity-based modal Stokes diameter ²⁾ 20.1 nm 1.3 nm Number-based modal diameter ³⁾ 19.4 nm 1.3 nm Intensity-weighted mean diameter ⁴⁾ 21.8 nm 0.7 nm ¹⁾ As obtained by dynamic light scattering according to ISO 22412:2008 (cumulants method). ²⁾ As obtained by centrifuge liquid sedimentation according to ISO 13318-1:2001 (line-start method); density 2.3 g/cm3. ³⁾ As obtained by electron microscopy (transmission electron microscopy/scanning electron microscopy). Indicative values for equivalent spherical diameter, volume-weighted mean and Zeta Potential.	Amp.
	BCR-066 - BCR-132 For these materials the distribution is expressed as a curve of the cumulative mass of particles undersize versus particle size. In the case of particles of less than 90 µm diameter their size is expressed as the equivalent Stokes' diameter determined from the settling rate of the particles in a viscous fluid. For larger particles the equivalent volume diameter determined by sieving was preferred.

New IRMM-304	Suspension of colloidal silica nanoparticles IRMM-304 is a quality control material of silica nanoparticles suspended in an aqueous solution. Information values (not certified) are assigned for frequency analysis and cumulant method using dynamic light scattering according to ISO 22412, as well as disc sedimentation according to ISO 13318. IRMM-304 is available in 10 mL pre-scored amber glass ampoules containing approximately 9 mL of suspension. The suspending medium is water-based and contains a small amount of NaOH as a stabilising agent. The nominal relative particle mass fraction in the suspension is 0.25 %.	Amp.

NIST-RM 8631a	Medium Test Dust (MTD) A unit of Reference Material NIST-RM 8631A, an ISO Medium Test Dust (MTD), consists of 20 g of a natural mineral dust that is heterogeneous in composition and polydisperse with respect to size. RM 8631a is intended to be used as a secondary material for calibrating particle sizing instruments, especially optical particle counters, when used in conjunction with either of two published standard methods. RM 8631a can be used in conjunction with either the National Fluid Power Association method (NFPA) method NFPA/T2.9.11 R1-1998 "Hydraulic Fluid Power - Calibration of Liquid Automatic Particle Counters" or the International Standards Organization method ISO 11171:1999 "Hydraulic Fluid Power - Calibration of Liquid Automatic Particle Counters". Using either of these two methods, the particle concentration of RM 8631a at each diameter will be determined by calibration against NIST Standard Reference Material NIST-2806A, Medium Test Dust (MTD) in Hydraulic Fluid. NIST-RM 8632 For use in preparing suspensions in other types of oil, further information on request. This material is intended for use in calibrating the response of particle sizing instrumentation, including optical counters, in accordance with National Fluid Power Association (NFPA) and ISO standard methods for determining particle contamination in oils.	20 g

Particle size calibration standards from Whitehouse Scientific

Whitehouse Scientific has been producing precision glass microspheres for calibration for 25 years and is the highest ranking European certification laboratory for primary methods of particle size analysis. Having filled over 1 million bottles using a unique 100 stage spinning riffler system, they are now the world's leading manufacturer of single-shot glass microsphere standards.

The references, nearly all NIST traceable range in size from 0.1µm - 5.0mm and are available as single sizes or broad distribution standards.

Whether calibrating a particle sizing instrument or any aperture in the range 0.1 - 10,000 microns, Whitehouse Scientific has a standard for every application.

Particle flow		
BCR-116	Limestone powders The flow of powders or granulated materials under the force of gravity affects the design and operation of silos used for their bulk storage. The European Federation of Chemical Engineering (EFCE) therefore developed a test method, based on the Jenike Shear Cell, to determine the shear strength of powders under different compaction and loading conditions. The complexity of this method is such that errors due to poor technique can easily arise. This CRM has therefore been produced with which laboratories can verify both their equipment and experimental technique. It is certified for shear stress as a function of normal applied stress for four different powder compaction stresses.	3.2 kg
Microhardness		
	NIST-1893 - NIST-2830 These materials are intended for use in calibrating and checking the performance of microhardness testers and may be used in conjunction with ASTM E384.	
NIST-1894a	Bright copper - Hardness (Vickers) This Standard Reference Material® (SRM®) is intended primarily for use in calibrating Vickers-type microhardness testers and is certified for mean Vickers hardness values (HV) at loads of 0.245 N, 0.49 N, and 0.98 N (0.025 kgf, 0.050 kgf, and 0.100 kgf, respectively). NIST-1894a consists of a 1.35 cm square test block of electrodeposited bright copper, approximately 1750 µm thick, on an AISI 1010 steel substrate, mounted in a thermosetting epoxy. Five indentations were made on the SRM's polished surface for each load. Hardness values are reported in Gigapascal (GPa) and kgf/mm². The SRM® was individually measured and bears a serial number imprinted on the side of the epoxy mount.	Each

NIST-1908	Bright nickel - Hardness (Vickers) This Standard Reference Material® (SRM®) is intended primarily for use in calibrating Vickers-type microhardness testers and is certified for mean Vickers hardness values (HV) at a load of 2.943 N (0.300 kgf). NIST-1908 consists of a 1.35 cm square test block of electrodeposited bright nickel, approximately 750 µm thick, on an AISI 1010 steel substrate, mounted in a thermosetting epoxy. Five indentations were made on the polished surface of the SRM®. Hardness value is reported in gigapascal (GPa) and kgf/mm². The SRM® was individually measured and bears a serial number imprinted on the side of the epoxy mount.	Each
NIST-1909	Bright nickel - Hardness (Vickers) This Standard Reference Material® (SRM®) is intended primarily for use in calibrating Vickers-type microhardness testers and is certified for mean Vickers hardness values (HV) at a load of 9.81 N (1.000 kgf). NIST-1909 consists of a 1.35 cm square test block of electrodeposited bright nickel, approximately 750 µm thick, on an AISI 1010 steel substrate, mounted in a thermosetting epoxy. Five indentations were made on the polished surface of the SRM®. Hardness value is reported in gigapascal (GPa) and kgf/mm². The SRM® was individually measured and bears a serial number imprinted on the side of the epoxy mount.	Each
NIST-2798A	Bright nickel - Hardness (Vickers) This Standard Reference Material (SRM®) is intended primarily for use in calibrating Vickers-type microhardness testers and is certified for mean Vickers hardness values (HV) at a load of 4.905 N (0.500 kgf). NIST-2798a consists of a 1.35 cm square test block of electrodeposited bright nickel, approximately 750 µm thick, on an AISI 1010 steel substrate, mounted in a thermosetting epoxy. Five indentations were made on the polished surface of the SRM®. Hardness value is reported in gigapascal (GPa) and kgf/mm². Particles and surface properties

Code	Product	Unit
NIST-2831	Vickers Hardness of Ceramics and Hardmetals This Standard Reference Material (SRM [®]) is intended for use in the calibration of all hardness and microhardness testing machines whereby a Vickers indentation is made and then measured with a microscope. The SRM has five NIST-made indents in the middle of a polished face certified for the individual diagonal lengths, the average diagonal length, and the average hardness value for indentations made at a load of 9.8 N (1 kgf). A unit of NIST-2831 consists of a 25 mm D × 9.5 mm disc that has a nominal hardness of approximately 15.0 GPa (1530 kgf/mm ²) packaged in a wooden box. Each unit is individually certified and bears a serial number scribed on the opposite (bottom) face of the disc. Vickers hardness is calculated as $HV = \alpha P/d^2$, where P is the indentation load, d is the average diagonal size $[(d_1 + d_2)/2]$, and α is the indenter constant, which, for an ideal Vickers indenter is 1.8544. If P is in units of Newton, and d is in units of meters, then HV will be in units of N/m ² or Pa. A conversion factor of 1×10^{-9} may be used to convert HV to units of GPa. In this certificate, older traditional units of hardness expressed as kgf/mm ² are also included in parenthesis for the convenience of users.	Each

NIST-2134	Arsenic in silicon - Depth profile This Standard Reference Material® (SRM®) is intended for use in calibrating secondary ion response to minor and trace levels of arsenic in a silicon matrix by the analytical technique of secondary ion mass spectrometry (SIMS). NIST-2134 is intended for calibrating the response of a SIMS instrument for arsenic in a silicon matrix under a specific set of instrumental conditions. It may also be used by a laboratory as a transfer standard for the calibration of working standards of arsenic in silicon. This SRM consists of a 1 cm x 1 cm single crystal silicon substrate that has been ion implanted with the isotope ⁷⁵As at a nominal energy of 100 keV. NIST-2134 is certified for the retained dose of 75 As atoms. The dose is expressed in units of arsenic mass per unit area. Additional noncertified information about the concentration of arsenic atoms as a function of depth below the surface is provided by SIMS. The total retained dose of ⁷⁵As atoms was determined by instrumental neutron activation analysis. Reference Nanomaterials

LGC Standards introduces reference nanomaterials range

LGC Standards has introduced the NM series reference nanomaterials to aid research and testing into the applications and impacts of nanotechnology.

One of the most comprehensive nanomaterial research programmes is being carried out by the Organisation for Economic Co-operation and Development's (OECD) Working Party on Manufactured Nanomaterials (WPMN). This programme focuses on the implications of the use of nanomaterials for human health and environment safety, focusing on testing and assessment methods. Master samples of the NM-series reference nanomaterials are stored in the nanomaterials repository of the European Commission's Joint Research Centre (JRC). The JRC distributes these master samples for use by EU Member States' authorities and in the OECD's Working Party on Manufactured Nanomaterials programme.

The NM nanomaterials available from LGC Standards encompass the OECD WPMN priority list of nanomaterials. These materials have been selected based on commercial importance and have been characterised using OECD recommended test methods and may serve as:

- Performance standard materials for testing and test method development
- Control materials for safety testing
- Testing materials for reference result and predictive toxicity testing

The materials have been produced from a selected homogenised master batch of raw material and sub-sampled under Good Laboratory Practice (GLP) conditions. The homogeneity and stability of all the samples follow the principles of ISO Guide 34 and are continuously monitored for stability under an isochronous monitoring study scheme.

Reference data

The NM nanomaterials are supplied with a Material Information Sheet. Available information includes material identification data such as CAS number, structural formula/molecular structure, composition (including degree of purity, known impurities or additives), basic morphology and surface chemistry.

Extensive data on the endpoints tested is being collated to provide further information on the material's Physical-Chemical Properties and Material Characterization, Environmental Fate and Mammalian Toxicology.

REACH applications:

The EU REACH regulations covering the Registration, Evaluation, Authorisation, and Restriction of Chemical Substances applies to nanomaterials.

As stated in the REACH guidance, registration dossiers should include "Available information from assessments carried out under other international and national programmes (...). Deviations from such assessments shall be justified". For nanomaterials an important source of assessments is those carried out by the Organisation for Economic Co-operation and Development's Working Party on Manufactured Nanomaterials, using these NM series products.

New NIST-2942	Relative intensity correction standard for fluorescence spectroscopy (Ultraviolet emission) 310 nm This Standard Reference Material (SRM) is intended for use in the evaluation and calibration of the relative spectral responsivity of steady-state fluorescence spectrometers with a continuous excitation source and for determining the day-to-day or instrument-to-instrument intensity variations of a single or similar fluorescence instrument(s), respectively. A unit of NIST-2942 consists of a single cuvette-shaped piece of solid glass. This SRM is certified for the relative, corrected emission spectrum, E, in relative energy units from emission wavelengths λ_{EM} = 320 nm to 430 nm at 1 nm wavelength intervals at a fixed excitation wavelength (λ_{EX}) of 310.1 nm.	Each
New NIST-2943	Relative intensity correction standard for fluorescence spectroscopy (Blue emission) This Standard Reference Material® (SRM®) is intended for use in the evaluation and calibration of the relative spectral responsivity of steady-state fluorescence spectrometers with a continuous excitation source and for determining the day-to-day or instrument-to-instrument intensity variations of a single or similar fluorescence instrument(s), respectively. NIST-2943 is a copper-doped (mole fraction of 0.01 % Cu₂O) phosphate-matrix glass. A unit of NIST-2943 consists of a single cuvette-shaped piece of solid glass. Each piece is a rectangular solid block with standard cuvette dimensions 12.5 mm × 12.5 mm × 45.0 mm, with three of the four long faces optically polished and one long face, the top face and the bottom face ground to a frosted finish using a 400 grit polish. The serial number of each unit is etched on the top face. There are 17 units of NIST-2943 Sample Series with serial numbers Cu0xx through yy. This SRM is certified for the relative, corrected emission spectrum, E, in relative energy units from emission wavelengths λ_{EM} = 350 nm to 640 nm at 1 nm wavelength intervals at a fixed excitation wavelength (λ_{EX}) of 330.3 nm. Due to larger signal-to-noise levels near the peak maximum, the emission range from λ_{EM} = 380 nm to 560 nm is recommended as optimal for most instruments and applications. Note that this standard's certified values become reference values when used for spectral correction of fluorescence spectrometers with pulsed light sources.	Each
NIST-2036	Near infrared wavelength/reflection standard This Standard Reference Material (SRM®) is a certified transfer standard intended for the verification and calibration of the wavelength/wavenumber scale of Near-Infrared (NIR) spectrometers operating in diffuse reflectance mode. NIST-2036 is a glass physically contacted with a piece of sintered polytetrafluoroethylene (PTFE). The combination of the rare earth oxide glass with a nearly ideal diffuse reflector provides reflection-absorption bands that range from approximately 15 % R to 40 % R. NIST-2036 is certified for the 10 % band fraction centroid of seven bands spanning the spectral region from 975 nm to 1946 nm (air wavelength). In addition, it is certified for the 10 % band fraction centroid location of the same seven bands in the spectral region from 10300 cm⁻¹ to 5130 cm⁻¹ at 8 cm⁻¹ resolution (vacuum wavenumber).	Each
NIST-2065	Ultraviolet-visible-near-infrared transmission wavelength/vacuum wavenumber standard This Standard Reference Material (SRM®) is a certified standard intended for the verification and calibration of the wavelength/wavenumber scale of ultraviolet (UV)-Visible-Near-Infrared (NIR) spectrometers operating in transmission mode. NIST-2065 is certified for the location of seven absorbance bands (COG) in the spectral region from 10300 cm⁻¹ to 5130 cm⁻¹ at 4 cm⁻¹ resolution. NIST-2065 is a glass consisting of a combination of rare earth oxides. The optical filter is 25 mm in diameter and 1.5 mm thick. Please ask for more details.	Each
NIST-2517a	High resolution wavelength calibration reference Intended for wavelength calibration in the spectral region of 1510 nm to 1540 nm. NIST-2517a is a single-mode optical-fibre-coupled absorption cell containing acetylene (¹²C₂H₂) gas at a pressure of 6.7 kPa (50 Torr). The absorption path length is 5 cm and the absorption lines are about 7 pm wide.	cell
NIST-2241	Relative Intensity Correction Standard for Raman Spectroscopy Using 785 nm Excitation NIST-2241 is a chromium-doped (0.02 mol % Cr₂O₃) sodium borosilicate matrix glass. One unit of this Standard Reference Material® consists of a glass slide that is approximately 10.7 mm in width × 30.4 mm in length × 2.0 mm in thickness, with one surface optically polished and the opposite surface ground to a frosted finish using a 400 grit polish. This Standard Reference Material® (SRM®) is a certified spectroscopic standard for the correction of the relative intensity of Raman spectra obtained with instruments employing 785 nm laser excitation. NIST-2241 consists of an optical glass that emits a broadband luminescence spectrum when excited with 785 nm laser radiation. The relative spectral intensity of the glass luminescence has been determined through the use of a white-light, uniform-source, integrating sphere that has been calibrated for its irradiance at NIST. The shape of the luminescence spectrum of this glass is described by a polynomial expression that relates the relative spectral intensity to the wavenumber (cm⁻¹) expressed as the Raman shift from the excitation wavelength of 785 nm. This polynomial, together with a measurement of the luminescence spectrum of the standard, can be used to determine the spectral intensity-response correction that is unique to each Raman system. The resulting instrument-intensity-response correction may then be used to obtain Raman spectra that are instrument independent. This SRM® is intended for use in measurements over the range of 20 °C to 25 °C and with Raman systems that employ laser excitation at 785 nm. It may also be used for Raman excitation with lasers that range from 784 nm to 786 nm in excitation wavelength.	Each

NIST-2242	Relative Intensity Correction Standard for Raman Spectroscopy NIST-2242 is a certified spectroscopic standard for the correction of the relative intensity of Raman spectra obtained with instruments employing 532 nm laser excitation. It consists of an optical glass that emits a broadband luminescence spectrum when excited with 532 nm laser radiation. The relative spectral intensity of the glass luminescence has been determined through the use of a white-light, uniform-source, integrating sphere that has been calibrated for its irradiance at NIST. The shape of the luminescence spectrum of this glass is described by a polynomial expression that relates the relative spectral intensity to the wavenumber (cm^{-1}) expressed as the Raman shift from the excitation wavelength of 532 nm. This polynomial, together with a measurement of the luminescence spectrum of the standard, can be used to determine the spectral intensity-response correction that is unique to each Raman system. The resulting instrument-intensity-response correction may then be used to obtain Raman spectra that are instrument independent. This Standard Reference Material (SRM [®]) is intended for use in measurements over the range of 20 °C to 25 °C.	Each
NIST-2243	Relative Intensity Correction Standard for Raman Spectroscopy This Standard Reference Material (SRM [®]) is a certified spectroscopic standard for the correction of the relative intensity of Raman spectra obtained with instruments employing either 488 nm or 514.5 nm laser excitation. NIST-2243 consists of an optical glass that emits a broadband luminescence spectrum when excited with either of these two laser wavelengths. The relative spectral intensity of the glass luminescence, for each excitation wavelength, has been determined through the use of a white-light, uniform-source, integrating sphere that has been calibrated for its irradiance at NIST. The shape of the luminescence spectrum of this glass is described by a polynomial expression that relates the relative spectral intensity to the wavenumber (cm^{-1}) expressed as the Raman shift from the excitation laser wavelength. This polynomial, together with a measurement of the luminescence spectrum of the standard, can be used to determine the spectral intensity-response correction that is unique to each Raman system. The resulting instrument-intensity-response correction may then be used to obtain Raman spectra that are instrument independent.	Each
New NIST-2244	Relative Intensity Correction Standard for Raman Spectroscopy Using 1064 nm Excitation NIST-2244 is a certified spectroscopic standard for the correction of the relative intensity of Raman spectra obtained with instruments employing 785 nm laser excitation. NIST-2241 consists of an optical glass that emits a broadband luminescence spectrum when excited with 785 nm laser radiation. The relative spectral intensity of the glass luminescence has been determined through the use of a white-light, uniform-source, integrating sphere that has been calibrated for its irradiance at NIST. The shape of the luminescence spectrum of this glass is described by a polynomial expression that relates the relative spectral intensity to the wavenumber (cm^{-1}) expressed as the Raman shift from the excitation wavelength of 785 nm. This polynomial, together with a measurement of the luminescence spectrum of the standard, can be used to determine the spectral intensity-response correction that is unique to each Raman system. The resulting instrument-intensity-response correction may then be used to obtain Raman spectra that are instrument independent.	Each

Starna optical reference materials

Starna[®] optical reference materials produced by Starna Scientific are available from LGC Standards. Starna Scientific was one of the first reference material producers in the UK to receive accreditation to ISO guide 34. The company has over 30 years experience in the development and production of liquid-filled, heat sealed quartz cells with good long term stability and the optical properties needed to evaluate performance of UV-visible spectrophotometers. The range also includes robust solid glass filter materials for both absorbance and wavelength measurements. These certified reference materials (CRM) for the validation of wavelength accuracy, absorbance accuracy, stray light and resolution in the UV and visible regions, can be used in analytical, clinical and research laboratories. All of the Starna[®] CRMs are traceable to NIST primary standards. Brief descriptions of the types of products available are given below with more detailed product descriptions in the pages that follow.

Absorbance / transmission

Potassium dichromate - UV absorbance and linearity

The use of potassium dichromate solvated in perchloric acid is an established and recognised method for the validation of the absorbance scale of UV and visible spectrophotometers. Starna[®] provides sets of certified sealed cells covering absorbance values from 0.2 to 3.0 over the wavelength range from 235nm to 350nm. For the far UV, nicotinic acid is the recognised standard and covers from 210nm to 270nm.

STRM-0204060810	Potassium dichromate - UV absorbance and linearity Set of 6 cells Each set consists of one blank (0.001M perchloric acid) and five concentrations, with nominal values of 20 mg/L, 40 mg/L, 60 mg/L, 80 mg/L, and 100 mg/L.	set

Wavelength		
	Starna® sealed liquid references are available covering all wavelengths from the far UV to the visible. For the UV and visible, rare earth oxides like holmium oxide, didymium (a mixture of neodymium and praseodymium) and samarium solvated in perchloric acid are well recognised as suitable wavelength references.	
STRM-HL	Holmium oxide - UV and visible wavelength Description: Holmium oxide (4% m/v) in 10% v/v perchloric acid. Primary usage: Assessment of wavelength scale accuracy in both UV and visible regions. Useable range: 240 nm to 650 nm, instruments with spectral bandwidth of less than 3 nm. Physical configuration: Far UV quartz cells that have been permanently heat sealed. Consists of one sealed cell, with certified peak at spectral bandwidth values of 0.10 nm, 0.25 nm, 0.50 nm, 1.00 nm, 1.50 nm, 2.00 nm and 3.00 nm.	cell
STRM-HL-R	Recertification: Holmium oxide - UV and visible wavelength	cell
STRM-DL	Didymium (neodymium & praseodymium) - UV and visible wavelength Description: Didymium (neodymium praseodymium) in perchloric acid. Primary usage: Assessment of wavelength scale accuracy in both UV and visible regions. Useable range: 290 nm to 870 nm, instruments with spectral bandwidth of less than 5 nm. Physical configuration: Far UV quartz cells that have been permanently heat sealed. Consists of one sealed cell, with certified peak at spectral bandwidth values of 0.10 nm, 0.25 nm, 0.50 nm, 1.00 nm, 1.50 nm, 2.00 nm and 3.00 nm.	cell
STRM-DL-R	Recertification: Didymium (neodymium & praseodymium) - UV and visible wavelength	cell
STRM-SL	Samarium - UV and visible wavelength Description: Samarium (III) oxide in perchloric acid. Primary usage: Assessment of wavelength scale accuracy in both UV and visible regions. Useable range: 230 nm to 560 nm, instruments with spectral bandwidth of less than 5 nm. Physical configuration: Far UV quartz cells that have been permanently heat sealed. Consists of one sealed cell, with certified peak at spectral bandwidth values of 0.10 nm, 0.25 nm, 0.50 nm, 1.00 nm, 1.50 nm, 2.00 nm and 3.00 nm.	cell
STRM-SL-R	Recertification: Samarium - UV and visible wavelength	cell
STRM-HG	Holmium glass filter - UV and visible wavelength Description: Holmium glass filter. Primary usage: Assessment of wavelength scale accuracy in the UV and visible regions. Useable range: 270 nm to 640 nm, instruments with spectral bandwidth of less than 10 nm. Physical configuration: Glass filters 'stress free' mounted in anodised aluminium holder. Consists of one filter, 'stress free' mounted in a proprietary NIST design, with certified peak at spectral bandwidth values of 0.10 nm, 0.25 nm, 0.50 nm, 1.00 nm, 1.50 nm, 2.00 nm, and 3.00 nm.	filter
STRM-HG-R	Recertification: Holmium glass filter - UV and visible wavelength	filter
STRM-DG	Didymium glass - UV wavelength Description: Didymium glass filter. Primary usage: Assessment of wavelength scale accuracy in the visible/near infrared region. Useable range: 430 nm to 890 nm, instruments with spectral bandwidth of less than 10 nm. Physical configuration: Glass filters 'stress free' mounted in anodised aluminium holder. Consists of one filter, "stress free" mounted in a proprietary NIST design, with certified peak at spectral bandwidth values of 0.10 nm, 0.25 nm, 0.50 nm, 1.00 nm, 1.50 nm, 2.00 nm, and 3.00 nm.	filter
STRM-DG-R	Recertification: Didymium glass - UV wavelength	filter
Far UV wavelength		
STRM-RE	Rare earth - UV and visible wavelength Description: Rare earth oxide in dilute sulphuric acid. Primary Usage: Assessment of wavelength scale accuracy in the UV region. Useable range: 200nm to 300nm, instruments with spectral bandwidth of less than 5nm. Physical Configuration: Far UV quartz cells that have been permanently heat sealed. Consists of one sealed cell, with certified peak at spectral bandpass values of 0.1 nm, 0.2 nm, 0.5 nm, 1.0 nm, 1.5 nm, 2.0 nm and 3.0 nm.	cell

Stray light														
	Inorganic cut-off filters – UV stray light This is a subtle source of error in UV and visible spectrophotometry. A variety of materials is available for measuring this parameter at several different wavelengths in the form of inorganic cut-off filters. They are designed with sharp cut-offs in transmissions at specified wavelengths which will enable any stray light to be measured. Description: Materials with sharp cut-offs in transmission at specified wavelengths. Primary usage: Detection of stray light in the UV region. Useable range: 200 nm to 260 nm, depending on the material. Physical configuration: Far UV quartz cells that have been permanently heat sealed.

Resolution														
	Accurate absorbance and wavelength measurements can only be achieved if due consideration is given to the resolution of the monochromator in use. In modern instruments with grating monochromators, the resolution relates directly to the slit chosen. The smaller the slit and its associated spectral bandwidth, the greater the resolution. Simple checks on the resolution power of a spectrophotometer with Starna® resolution CRMs such as benzene vapour or toluene in hexane will provide useful references. Benzene vapour is used to validate the resolution of instruments with bandpass less than 1nm. Even this material can be supplied heat sealed into a quartz cell. An alternative liquid reference, toluene in hexane, helps users to meet the recommendations of the current European Pharmacopoeia.													
STRM-TX	Toluene in hexane - resolution Description: 0.020% v/v solution of toluene in hexane. Primary usage: Determination of spectral bandwidth in the UV region. Useable range: 265 nm to 270 nm, instruments with a spectral bandwidth of less than 3 nm. Physical configuration: Far UV quartz cells that have been permanently sealed. This formulation is described and used in the European Pharmacopoeia where the ratio of the peak maximum at 269 nm to the minimum at 266 nm gives a measure of the resolution of the instrument. Ratio table: <table><tr><td>SBW (nm):</td><td>0.5</td><td>1.0</td><td>1.5</td><td>2.0</td><td>3.0</td></tr><tr><td>Ratio:</td><td>2.5</td><td>2.1</td><td>1.6</td><td>1.4</td><td>1.0</td></tr></table>	SBW (nm):	0.5	1.0	1.5	2.0	3.0	Ratio:	2.5	2.1	1.6	1.4	1.0	set

STRM-BZ	Benzene vapour Description: 0.1 mL benzene in the vapour state. Primary usage: Determination of spectral bandwidth in the UV region. Useable range: 230 nm to 270 nm, instruments with a spectral bandwidth of less than 1 nm. Physical configuration: Far UV quartz cells that have been permanently heat sealed. At spectral bandwidths less than 1 nm, the benzene vapour spectrum provides a useful reference that has characteristic features that may or may not be displayed – dependent upon the current spectrophotometer spectral bandwidth. Benzene vapour will not work well with a photodiode array spectrophotometer as this instrument type does not measure a continuum and the peaks will not be resolved well enough to be useable.	cell

STRM-RM-NIR	Certified NIR wavelength reference for transmittance measurements	cu.v.
	Liquid reference material, permanently heat-fused sealed in a high quality far-uv quartz cuvette. Configuration Transmittance: 10 mm optical path length, both linear path optical window clear, opposed sides "grey" Certification: Complete with certificate of wavelength values and associated expanded uncertainty, for 13 assigned peak values in the range 950 - 2550 nm.	
STRM-RM-NIR/T	Certified NIR wavelength reference for transmittance and trans-flectance measurements	cu.v.
	Liquid reference material, permanently heat-fused sealed in a high quality far-uv quartz cuvette. Configuration Transmittance/Trans-flectance: 5 mm or 10 mm optical path length, depending on orientation, In 5 mm configuration, rear window mirror coated to provide reflectance optical return - so path length effectively 2 x 4 = 10 mm Certification: Complete with certificate of wavelength values and associated expanded uncertainty, for 13 assigned peak values in the range 950 - 2550 nm.	

Reference material for nucleic acid analysis

New	STDNACON260280	Wavelength accuracy in critical nucleic acid measurements - 260/280 nm measurement ratio	cell
		This control material has been specifically designed to assure the wavelength accuracy in critical nucleic acid measurements. DNACON260/280 which suffers from none of the inherent stability problems associated with DNA has been created for use as a new reliable NIST traceable Quality Control Standard by clinical and bioscience laboratories analysing and evaluating the purity of a range of nucleic acids such as DNA, RNA, RNAi and ssDNA. It consists of a Far UV quartz cell which has been permanently sealed by heat fusion. It contains a solution of Starna DNACON 260/280, which has been designed to give a spectrophotometric 260/280 nm measurement ratio similar to that achieved when measuring pure DNA. This standard is produced in an ISO 17025 and ISO Guide 34 accredited environment, meeting the highest available regulatory standards.

Code	Product	Unit
New NIST-191D	pH Standard This Standard Reference Material® (SRM®) is intended for use in preparing solutions for calibrating electrodes for pH measuring systems. NIST-191d consists of two components, each prepared to ensure high purity and uniformity: sodium bicarbonate, NaHCO₃ (191d-I); and sodium carbonate, Na₂CO₃ (191d-II). A unit of NIST-191d consists of 25 g of sodium bicarbonate (191d-I) and 30 g of sodium carbonate (191d-II), each contained in its respective clear glass bottle. Certified value pH (25 °C)..... 10.014 Certified values of pH at 10 °C, 15 °C, 20 °C and 35 °C are given in the CoA.	set (2)
NIST-RM 8040	Sodium oxalate - Reductometric This Reference Material (RM) was prepared to provide material of uniform, high purity for use as a working standard for oxidation-reduction reactions. Reference value Reductometric assay (mass fraction) 99.951 % ± 0.038 %	60 g

Biological buffer systems

	NIST-2181 - NIST-2184 These materials are intended for use in preparing a standard solution for calibrating clinical instruments (e.g. blood pH measurements), in the physiologically important range of pH 7-8. They are based on a biological buffer system for clinical pH measurements and are certified for use as an admixture only. The pH values for the buffer solutions are certified at 0.05 and 0.08 M with respect to the free acid and the sodium salt admixture as a function of temperature. The certified temperature range is from 0-50 °C.	
	NIST-2181 - NIST-2184 Both materials are required to prepare a standard solution.	
NIST-2181	HEPES free acid Certified values <u>0.05M</u> pH (0-50 °C)..... 7.832-7.216 <u>0.08M</u> pH (0-50 °C)..... 7.853-7.222	60 g

NIST-2541	Silicon chip - Resistivity 100 mm (D) x 0.625 mm Czochralski-grown, boron-doped silicon wafer with (100) crystallographic orientation. Certified value Resistivity..... 0.1 $\Omega\cdot\text{cm}$	unit
NIST-2546	Silicon chip - Resistivity 100 mm (D) x 0.625 mm Float zone silicon with (111) orientation and phosphorus-doped by the neutron transmutation doping process. Certified value Resistivity..... 100 $\Omega\cdot\text{cm}$	unit
NIST-RM 8420	Electrolytic iron rod 0.64 cm (D) x 5.0 cm Thermal conductivity and electrical resistivity as a function of temperature (2-1000 K)	rod

Superconducting critical current

NIST-1457	Niobium-titanium wire - Critical current 8.7 cm diameter spool Intended for checking the performance of measurement systems used in superconductor technology. It consists of 2.2 m of a multifilamentary niobium titanium, copper-stabilised superconducting wire wound in a single layer onto a spool with a core diameter of 8.7 cm. Certified values for critical current at 4.2 K and 0.2 $\mu\text{V}/\text{cm}$	Each

Dielectric constant

NIST-774	Lead-silica - Dielectric constant 5 cm x 5 cm x 2.5 cm Intended for checking methods used to determine dielectric constant and ac loss characteristics of insulating materials per ASTM D 150. Certified value: K ~7.47 at 100 Hz	Each

Viscosity oil standards

	PSL2700V01 - PSL2700V19 These standards are calibrated by the PSL Calibration ISO 17025 Accredited Laboratory. The standards will be supplied complete with UKAS calibration certificates and have direct traceability to NIST and other international laboratories. Uncertainties of measurement are stated on the calibration certificates. Long shelf lives are provided by using stable base oils. The viscosity oil standards are suitable for the calibration and verification of the following: • Glass Capillary viscometers • Automated Kinematic Viscometer Systems • Rotational/Cone & Plate Viscometers • Low Temperature Viscometer Systems • Cold Cranking Simulators • Flow Cups

Certified liquids for viscosity measurements in the European Pharmacopoeia

Newtonian liquids with a certified viscosity are supplied by Van Swinden Laboratorium BV and are distributed by LGC Standards.

Liquids are available with kinematic viscosities up to 48000 mm²·s⁻¹ and certified at temperatures between 15°C and 140°C.

Viscosities are certified in mm²·s⁻¹ (kinematic viscosity, ν) or in mPa·s (dynamic viscosity, η)

1 mPa·s = 1 cps (centipoise) 1 mm²·s⁻¹ = 1 cst (centistoke)

Standard liquids are available from stock, in 250 ml packs and certified at 20°C to following viscosities:

ν = 0,6 ; 1,0 ; 2,2; 4,9 ; 1; 20 ; 31 ; 56 ; 67 ; 85 ; 100 ; 132 ; 167 ; 217 ; 262; 340 ; 423 ; 537 ; 644 ; 783 ; 1000 ; 1260 ; 1800 ; 3650 ; 5075 ; 10175 ; 18400 ; 46500

η = 0,4 ; 1,0 ; 1,8; 4,0 ; 8,9 ; 17,0 ; 26,0 ; 48,0 ; 58,0 ; 74,0 ; 87,0 ; 116,0 ; 146,0 ; 191,0 ; 230,0 ; 300,0 ; 375,0 ; 474,0 ; 572,0 ; 700,0 ; 862,0 ; 1085 ; 1560 ; 3175 ; 4430 ; 8935 ; 16300 ; 41300

All viscosities are calibrated relative to the viscosity of pure water. Stated values are nominal values, certified values will not deviate more than 10% from the nominal value.

The uncertainty of the certified viscosities is at least 0.3% at the lowest viscosity, increasing up to 0.5% at 48000 mm²·s⁻¹.

Shelf life

Standards up to 500 mPa·s are mineral oil based, and have a shelf life of 12 months from date of certification. Above 500 mPa·s Polyisobutylene is used; these materials have a shorter shelf life, and should be ordered as needed.

Liquids can be prepared and certified to any viscosity between 0.6 mm²·s⁻¹ and 80,000 mm²·s⁻¹.

The price depends on the viscosity required, the degree of precision between nominal viscosity required and certified viscosity achieved, and temperature of certification.

Additional charges are applied for extra certification temperatures and for certification of dynamic viscosity. Please ask for a quotation.

Liquids supplied by customers may be certified for viscosity, charges vary: please ask for a quotation.

NIST-2491	Non-Newtonian polymer melt for rheology This Standard Reference Material® (SRM®) is intended primarily for use in calibration and performance evaluation of instruments used to determine the viscosity and first normal stress difference in steady shear, or to determine the dynamic mechanical storage and loss moduli and shift factors through time-temperature superposition. NIST-2491 consists of polydimethylsiloxane. The supplier identifies the polydimethylsiloxane as having a number average molecular mass of 308,000 g/mol. Certified values of the viscosity and first normal stress difference as functions of shear rate are given in the certificate at temperatures of 0 °C, 25 °C, and 50 °C, respectively. The expanded combined uncertainties in the certified values of the viscosity and first normal stress difference are also listed. The certified values of the storage modulus G' and loss modulus G'' as functions of frequency at 0 °C, 10 °C, 20 °C, 30 °C, 40 °C, and 50 °C, respectively are also given in the certificate.	100 mL

Scanning electron microscope

NIST-2069b	SEM Performance Standard Graphitised rayon fibres with smooth and uniform edges on a 12.5 mm diameter SEM specimen mount with a 3 mm peg. One edge of a single fibre is used as a clearly defined boundary across which the electron beam is scanned. The slope of the resultant detector signal waveform is a measure of the SEM performance that can be related to the resolution capability of the SEM.	Each
NIST-RM 8091	Scanning Electron Microscope Sharpness Standard This Reference Material (RM) is intended primarily for use in checking the sharpness of scanning electron microscopes. It is supplied as a small (3mm x 2 mm) diced semiconductor chip. Please ask for further details.	Each
New NIST-RM 8820	Scanning electron microscope scale calibration artifact Reference Material (RM) 8820 is primarily intended to be used for X and Y scale (or magnification) calibrations from less than 10 times magnifications to more than 100 000 times magnifications in scanning electron microscopes (SEMs). It was designed to provide good contrast at low and high electron landing energies (accelerating voltages). Beyond testing scale calibration, it can be used for non-linearity measurements, especially at lower than 10 000 times magnifications. It can also be used for optical and scanning probe and other types of microscopes. Most SEMs require a set of calibration structures of different sizes to cover the full range of possible magnifications. This Reference Material (in part using the ideas implemented in earlier NIST scale calibration artifacts) is designed to meet that need. A unit of RM 8820 consists of a 20 mm × 20 mm lithographically patterned silicon chip.	35-40 g

X-ray diffraction

New NIST-640D	Silicon powder line position + line shape standard for powder diffraction This Standard Reference Material (SRM) is intended for use as a standard for calibration of diffraction line positions and line shapes, determined through powder diffractometry. A unit of NIST-640d consists of approximately 7.5 g of silicon powder bottled under argon. The certified lattice parameter for a temperature of 22.5 °C is 0.357 123 nm ± 0.000 008 nm	7.5 g
NIST-656	Silicon nitride This Standard Reference Material (SRM®) consists of two powders intended for quantitative analysis of the α and β polymorphs of silicon nitride via powder diffraction methods. The powders are combinations of the α and β polymorphs; one is high in the α phase content (α 656), while the other contains a larger amount of the β polymorph (β 656).	2 x 10 g

NIST-674b	X-Ray powder diffraction intensity set This Standard Reference Material (SRM[®]) consists of four oxide powders intended primarily for use as internal standards for quantitative X-ray diffraction analysis. The powders are ZnO (wurtzite structure), TiO₂ (rutile structure), Cr₂O₃ (corundum structure), and CeO₂ (fluorite structure). These four oxides offer a range of linear attenuations for Cu-Kα radiation: 279 cm⁻¹, 536 cm⁻¹, 912 cm⁻¹, and 2203 cm⁻¹, respectively, that allow the user to nominally match that of standard to the unknown in order to minimize the effects of microabsorption. NIST-1976a	Alumina plate - Instrument response Standard for X-Ray Powder Diffraction This Standard Reference Material (SRM[®]) consists of a sintered alumina disc intended for use in calibration of X-ray powder diffraction equipment with respect to line position and intensity as a function of 2Θ angle. The solid form of the SRM eliminates variability imposed by sample loading procedure from intensity measurements. A unit of NIST-1976a consists of a sintered alumina disc approximately 25.6 mm in diameter by 2.2 mm in thickness Please ask for further details	disc												
NIST-1990	Single Crystal Diffractometer Alignment Standard - Ruby Sphere Standard Reference Material (SRM[®]) 1990 is intended primarily for use as an alignment standard for single crystal diffractometry. One unit consists of three chromium-doped single crystal aluminum oxide (ruby) spheres. The spheres are nominally 152 mm in diameter with 1.3 mm sphericity. The spherical geometry was chosen to facilitate alignment and to avoid corrections for absorption. These spheres produce reflections at high angles for copper and molybdenum radiation. The space group is R3c. Certified lattice parameters of NIST-1990 at 25 °C are: a: 0.476080 nm ± 0.000029 nm c: 1.299568 nm ± 0.000087 nm	3 spheres												
NIST-1994	Standard silicon single crystal wafer for crystalline orientation This Standard Reference Material (SRM[®]) is intended for use in the calibration of instruments (X-ray diffractometers) used to measure the crystal orientation of wafers relative to the crystal surface. The SRM unit consists of a 100-mm diameter silicon wafer. The crystal orientation of the (001) silicon crystal planes relative to the surface normal has been measured both parallel and perpendicular to an edge flat that is manufactured into the wafer.	unit												
New NIST-1995	Standard sapphire single crystal wafer for crystalline orientation This Standard Reference Material[®] (SRM[®]) is intended for use in the calibration of instruments (X-ray diffractometers) used to measure the crystal orientation of wafers relative to the crystal surface. HDF01	2,2,4-Trimethylpentane Temperature range 15-25 °C Certified value Liquid density (20 °C)..... 692 kg/m ³	10 mL
HDF02	Dodecane Temperature range 10-50 °C Certified value Liquid density (20 °C)..... 750 kg/m ³	10 mL
HDF04	Base lubricating oil approx. 8 mPa.s at 40°C Temperature range 15-50 °C Certified value Liquid density (20 °C)..... 868 kg/m ³	10 mL
HDF05	Base lubricating oil approx. 30 mPa s at 40°C Temperature range 15-50 °C Certified value Liquid density (20 °C)..... 870 kg/m ³	10 mL
HDF06	Base lubricating oil approx. 110 mPa s at 40°C Temperature range 15-50 °C Certified value Liquid density (20 °C)..... 882 kg/m ³	10 mL
HDF07	Lubricating oil A90 approx. 160 mPa s at 40°C Temperature range 15-50 °C Certified value Liquid density (20 °C)..... 887 kg/m ³	10 mL
HDF08	Ethanol in water approx. 41 % ABV Use of this material is not recommended unless required by fiscal authorities. Certified value Liquid density (20 °C)..... 948 kg/m ³	10 mL
HDF09	Ethanol in water approx. 11 % ABV Use of this material is not recommended unless required by fiscal authorities. Certified value Liquid density (20 °C)..... 985 kg/m ³	10 mL
HDF15	Water Certified value Liquid density (20°C)..... 998 kg/m ³	10 mL
HDF10	Dextrose in water approx. 10 % by weight Use of this material is not recommended unless required by fiscal authorities. Certified value Liquid density (20 °C)..... 1037 kg/m ³	10 mL
HDF13	Sodium bromide in water Temperature range 15-25 °C Certified value Liquid density (20 °C)..... 1264 kg/m ³	10 mL
HDF14	Caesium chloride in water approx. 47% by weight Certified value Liquid density (20°C)..... 1525 kg/m ³	10 mL
HDF12	Tetrachloroethylene Temperature range 15-50 °C Certified value Liquid density (20 °C)..... 1623 kg/m ³	10 mL
	GUM1.1 - GUM1.11	
	Liquid density standards certified by the Central Office of Measures (GUM). Intended for calibration and checking densimeters used for measuring density of liquids. Supplied with a certificate showing density values at temperatures from 20 °C to 50 °C, with an uncertainty 0.05 kg/m ³ . Values for the first and second decimal place are given in the certificate for particular series.

Chemical resistance (durability) of glass

	NIST-622 and NIST-623 These NIST Standard Reference Materials® are for checking test methods and calibrating equipment used to determine the resistance of glass containers to chemical attack. The values given represent the volume of fiftieth-normal sulphuric acid used to titrate to the methyl red end point of the alkaline extract from a crushed sample of glass after exposure to high purity water at 121 °C.	
NIST-622	Soda lime silica (durability) Certified value Volume of 0.02N H ₂ SO ₄ 7.67 mL	2.2 kg
NIST-623	Borosilicate glass Certified value Volume of 0.02N H ₂ SO ₄ 0.34 mL	2.2 kg

Multi-test verification materials (MTVMs)

	The Multi-Test Verification Materials (MTVMs) are unique because they enable a laboratory to use a single sample to validate different tests and instrumentation. Each unit is supplied with data for multiple types of internationally accepted test methods.

BCR-692	Scratch test reference material A reference material certified for critical loads for cohesive/adhesive failures during scratch testing (prEN 1071-3). The reference samples are (30x30x5) mm steel coupons coated with a diamond-like carbon coating (DLC) applied by plasma-assisted chemical vapour deposition. The coupons are distributed in a reusable plastic box containing desiccant.	coupons
NIST-2100	Fracture Toughness of Ceramics NIST-2100 is intended for verification of fracture toughness testing procedures and consists of a set of five hot-pressed silicon nitride flexure specimens cut from a single billet (plate) of material. This SRM may be used with any fracture toughness test method, but is optimized for beam bending testing configurations. The SRM may be used in conjunction with American Society of Testing and Materials (ASTM) fracture toughness standard C1421-99 (or the Provisional Standard PS070-97 which preceded it) [1]. This SRM may also be used with two International Organization for Standardization (ISO) standard tests under development by ISO Technical Committee TC 206, Fine Ceramics.	5 bars

Magnetic moment

NIST-762	Magnetic moment standard - Nickel disc This Standard Reference Material® (SRM®) is intended for use in the calibration of magnetometers (such as vibrating sample magnetometers) used in the measurement of the magnetic properties of materials. NIST-762 consists of a nickel disc nominally 6 mm in diameter with a thickness of 0.127 mm and a mass of 32 mg ± 1 mg. The NIST-762 lot was produced from rolled nickel sheet with a purity of 99.999 %. Discs were punched from the sheet. Before measurement, the discs were ultrasonically cleaned in acetone, then methyl alcohol. The certified value for specific magnetization, σ at 298 K and in an applied magnetic field of 398 kA/m (5000 oersted, Oe) with the magnetic field aligned parallel to the plane of the disc is: σ = 54.78 A m ² /kg ± 0.15 A m ² /kg (54.78 emu/g ± 0.15 emu/g)	6 mm dia.
NIST-764a	Magnetic susceptibility standard - Platinum cylinder This Standard Reference Material (SRM®) is intended for use in the calibration of magnetometers (such as vibrating sample magnetometers) used in the measurement of the magnetic properties of materials. NIST-764a consists of a platinum (Pt) cylinder with a nominal diameter of 3 mm, a nominal length of 3.42 mm, and a nominal mass of 620 mg. NIST-764a lot was produced by slicing a pure (99.99 %) platinum rod into 3.42 mm long pieces.	3 mm dia.
NIST-2853	Magnetic moment standard yttrium iron garnet sphere This Standard Reference Material (SRM®) is intended for use in calibrating of magnetometers (such as vibrating sample magnetometers) used in the measurement of the magnetic properties of materials. NIST-2883 consists of a yttrium iron garnet (YIG) sphere with a nominal diameter of 1 mm and a nominal mass of 2.8 mg.	Each

NIST-772a	Nickel sphere for magnetic moment This Standard Reference Material (SRM) is intended for use in the calibration of magnetometers (such as vibrating sample magnetometers) used in the measurement of the magnetic properties of materials. SRM 772a consists of a nickel sphere 2.383 mm in diameter with a mass of 63.16 mg. The SRM 772a lot was produced from annealed nickel wire with a purity of 99.999 %. The wire was ground into spheres. The spheres were then ultrasonically cleaned in acetone and methyl alcohol and annealed at 1220 K in a dry hydrogen atmosphere for 2 h. The microstructure is equiaxed with an average grain size of about 100 µm. The certified value for magnetic moment, m, at 298 K and in an applied field of 398 kA/m (5000 Oe) is $m = 3.47 \text{ mA}\cdot\text{m}^2 \pm 0.01 \text{ mA}\cdot\text{m}^2$ (3.47 emu $\pm$ 0.01 emu)	Each

ULTRASep™ Filters

ULTRASep™ TSS Filters for Standard Methods 2540C and 2540D

ULTRASep™ TSS Filters are specifically designed to ensure compliance with the filter preparation requirements of Standard Methods 2540 C (Total Dissolved Solids Dried at 180°C) and Standard Methods 2540 D (Total Suspended Solids at 103-105°C). You can now easily differentiate the wrinkle side from the screen side of the filter, since we've made the wrinkle side visibly different. There is no guesswork for you! Now everyone can clearly see and easily determine which side needs to face up to ensure compliance.

These 1.5 µm binder-free, fast flowing, fine porosity borosilicate glass microfiber filters have been optimised to eliminate pin holing and minimize fibre shedding, two quality issues known to affect other brands of TSS filters. ULTRASep™ TSS Filters are readily available in the most popular sizes used in a wide variety of CoorsTek chemical-porcelain labware including Bitumen, Buchner, Gooch, Hirsch, and many other popular filter holders.

eVol® hand-held automated analytical syringe

eVol® is the coupling of two precision devices:

a digitally controlled electronic drive and an XCHANGE® enabled analytical syringe.

The result is a digitally controlled positive displacement dispensing system that is programmable to reproducibly and accurately perform a wide variety of liquid handling procedures.

eVol® will improve your laboratory workflow and reporting confidence in many ways.

Key benefits

- The programmable digital drive means liquid handling procedures are user independent allowing more efficient workflow scheduling and a reduction in the re-analysis of incorrectly processed or false positive samples.
- XCHANGE® analytical syringes are easily and quickly changed allowing them to be dedicated to individual liquids to prevent possible cross-contamination of reagents.

Precise user-independent dispensing

Unlike air-displacement devices, such as pipettors, eVol® is the perfect solution for accurately aspirating and dispensing both aqueous and non-aqueous liquids.

eVol® features a familiar Touch Wheel user interface and a full-color screen. The clever menu allows all the functions to be accessed logically and quickly. The programming functions are intuitive and include help screens and prompts.

World's first user calibrated analytical syringe

To comply with your stringent laboratory standards (e.g. GLP, GMP, FDA) eVol® is easily calibrated to ensure accurate dispensing at all times. The gravimetric calibration procedure is simple, intuitive and can be performed at appropriate intervals. Calibration factors can be stored for up to ten XCHANGE® syringes and are quickly loaded when the syringe is changed.

Typical applications for eVol® include

- Preparation of calibration standards
- Addition of internal standards
- Precise dispensing of non-aqueous liquids
- Sample dilution

Only three XCHANGE® syringes are required to dispense liquid volumes covering the range from 200 nL to 500 µL.

eVol® NMR Edition

		eVol® NMR Edition is the world's first electronic syringe for NMR capillaries. It has been designed for the specific needs of NMR: • Small sample quantities • Requirement for very high levels of accuracy and reproducibility • Alternative to high cost consumables • Specialist samples and solvents eVol® NMR Edition allows accurate manipulation of small volumes of NMR samples enabling dilution directly in the analysis tube - even in tubes with the smallest internal diameters. eVol® facilitates in-tube sample mixing and enables recovery of precious samples allowing them to be stored in alternative vessels (such as inexpensive vials) rather than being left in valuable tubes. These tubes can now be emptied using eVol®, for washing and re-use. eVol® benefits in NMR • Facilitates small volume manipulation • Operator independent accuracy, precision and reliability • Increased speed of sample processing

Introduction

Picograde® solvents for residue analysis

Picograde® solvents form the heart of the LGC Standards solvent range. Each batch undergoes rigorous testing in order to meet the demanding requirements of organic trace analysis every time.

Environmental analysts are now expected to detect trace levels of an increasingly wide range of organic environmental contaminants including pesticides, PAHs, PCBs, PCDDs/PCDFs etc. with the highest possible accuracy. Consequently even the lowest levels of impurity in the solvent can affect the precision of analytical results. Picograde® solvents are specifically tailored to this application.

Carefully selected raw materials are chemically pre-treated and then fractionated in glass in the absence of air. Distillation and filling are similarly carried out in air free conditions. The glass bottles are sterile and dust free and are rinsed with the appropriate solvent prior to filling. Caps used to seal the bottles are subjected to the same stringent cleaning processes. The specification of the solvent includes the determination of water content, residue on evaporation and a comprehensive gas chromatographic analysis.

To confirm the absence of contaminants samples of the solvent are concentrated to varying degrees and then analysed by gas chromatography. Flame ionisation and electron capture detectors (ECD) are used for the quantification of the contaminants. The specification of the Picograde® solvent guarantees that no signal due to contamination will be larger than the internal standard peak (10 pg/mL heptachlor-epoxide) in the retention time window from 1,4-dichlorobenzene to decachlorobiphenyl. The very high specification of the Picograde® solvents allows them to be used for residue analysis of trace quantities of organic contaminants right down to ppb and ppt levels.

Optigrade® - High purity solvents for HPLC

High performance liquid chromatography is now an essential analytical tool especially in the areas of research and development, pharmaceutical quality control and analysis in the food and environmental sectors. This technique demands the highest quality solvents to allow reproducible separations. The basic requirements include a high UV-transmission factor, low particle levels, slight acidity and alkalinity coupled with low levels of water and other non-volatile components. In addition there must be consistency between batches.

Solvents for isocratic analytical HPLC together with gradient grade quality solvents are included in the HPLC range. Gradient grade has the highest purity and is specially designed for use with gradient elution HPLC using reversed phase materials and UV or fluorescence detection. Quality assurance procedures allow LGC Standards to offer a consistently premium quality product. Each batch is checked to make sure that the solvent has the required high level of UV-transmission in the wavelength range 190-350 nm.

Solvents for LC/MS

The presence of alkali and alkaline earth metals in the mobile phase when using LC/MS can make the interpretation of the mass spectrum very difficult. LGC Standards offers solvents designed for this technique with extremely low levels of these metals, at 0.1 ppm and less.

Solvents for Ultra HPLC (UHPLC)

ULTRA HPLC (UHPLC) requires solvents of superior quality. A new range of high purity Optigrade® solvents from LGC Standards has been designed to allow high resolution and sensitivity. Such Ultra HPLC solvents combine the highest specification for: UV, low gradient shift, minimal peak impurities and lowest ionic background for MS detection. All Ultra HPLC solvents are micro filtered at 0.1 µm, have a residue following evaporation of max 1 ppm and are packed under inert gas for improved shelf life. Also available are selected buffers for mobile phase preparation and several blends of water and acetonitrile with formic acid, acetic acid and trifluoroacetic acid are offered.

Specialist solvents

- **Solvents for VOCs and aromatic hydrocarbons**

It has become increasingly necessary to be able to determine a range of organic compounds in environmental samples including volatile organic compounds (VOCs) and BTEX-aromatics. Various extraction techniques are used for the separation and concentration of organic trace constituents from the sample matrix and it is essential to use solvents with very low levels of contamination. LGC Standards can provide the solvents to meet these exacting requirements.

- **Solvents for GC headspace techniques**

Analysis of volatile organic impurities using the GC headspace technique has become an important quality control tool in pharmaceutical and food related industries. The International Conference on Harmonization of technical requirements for registration of pharmaceuticals for Human use (ICH) has issued recommendations concerning the safe levels of residual solvents in pharmaceutical compounds. These solvents are divided into 3 classes according to their toxicity. Limit values of residual solvents in pharmaceutical products are specified by the United States and European Pharmacopeia. The quality of the solvent used to dissolve the sample is of prime importance. It must be of the highest purity and show virtually no background signal with both polar and non polar GC capillary columns. The new headspace solvents are high boiling point solvents, specifically developed, analysed and packed for the headspace analysis of volatile solvent impurities.

- **Solvents for the analysis of nitrosamines**

When extracting trace levels of nitrosamines in samples it is important to use a solvent that is free of nitrosamine contamination. For this application LGC Standards has solvents with a maximum level of 0.1ppb of specific nitrosamines.

- **Solvents for the tobacco industry**

High purity acids

LGC Standards offers the most frequently used mineral acids for trace analysis: hydrochloric acid, nitric acid, hydrofluoric acid, sulfuric acid, perchloric acid and acetic acid. These are produced by sub-boiling distillation of very pure starting materials. This purification results in most metallic impurities reduced to (or below) ppb ranges. The acids are delivered in special bottles (long-term leached borosilicate glass or modified HDPE) which ensure minimum contamination of the acid from the material of the bottle.

Important note: Element concentrations are at the point of bottling. Concentrations of some elements may increase due to the storage container.

The UK Chemical Calibration Facility (UKCCF) at LGC

The UK Chemical Calibration Facility (UKCCF) at LGC has been set up to help organisations involved in chemical analysis make accurate and traceable measurements.

LGC's internationally recognised analytical scientists with a unique combination of state-of-the-art chromatography and mass spectrometry methods, are able to offer a range of highly specialist calibration and measurement services and advice to:

- Calibration service providers
- Proficiency testing scheme organisers
- Reference material producers
- Standards and regulatory bodies
- Quality laboratories.

The facility is part of the UK's designated National Measurement Institute for chemical and bioanalytical measurements.

The UKCCF provides advice and solutions to a wide range of quality and measurement issues:

- Confirmation of product specification against standards and regulations;
- Independent verification of in-house quality control materials;
- Compliance with quality standards such as ISO/IEC 17025, GLP/GMP, ISO 9001, ISO 15189;
- Dispute resolution e.g. product specification and quality;
- Problem solving e.g. reliable identification of measurement bias;
- Credibility and confidence to compete in the international market place.

Product index

Diethylcarbamazine citrate	440	O,O-Dimethyl dithiophosphate sodium salt	333, 689, 700	2,6-Dinitrotoluene (methyl-D3,98%)	672, 677
Diethylene glycol (D8,98%)	663	Dimethyl endothall	333, 738	2,6-Dinitrotoluene	462, 485, 672, 797
Diethylene glycol	663	2,4-D-methyl ester	327	3,4-Dinitrotoluene	462, 736, 777, 797
Diethyl ether (D10,99%)	676	1,2-Dimethyl-3-ethylbenzene	484	3,5-Dinitrotoluene	462
Diethyl ether	483	1,2-Dimethyl-4-ethylbenzene	484	Dinobuton	334
Diethyl ether HPLC Optigrade®	902, 903	1,3-Dimethyl-4-ethylbenzene	484	Dinocap (ring-13C6,99%)	334, 689
Diethyl ether Picograde® for residue analysis	903	1,3-Dimethyl-5-ethylbenzene	484	Dinocap	334
O,O-Diethyl hydrogen dithiophosphate	332, 483, 700	1,4-Dimethyl-2-ethylbenzene	484	Dinoseb	334
Diethyl hydrogen phosphate	332, 483, 700	4-(1,4-Dimethyl-1-ethylpentyl) phenol	665	Dinoseb acetate	334
O,O-Diethyl hydrogen thiophosphate	332, 483, 700	4-(1,3-Dimethyl-1-ethylpentyl) phenol	665	Dinoseb methyl ether	334
O,O-Diethyl hydrogen thiophosphate potassium salt (diethyl-D10,98%)	332, 483, 685, 689, 700	4-(1,3-Dimethyl-1-ethylpentyl)phenol (ring-13C6,99%)	665	Dinoterb	334
Diethyl methylphosphonate	484	4-(Dimethyl-1-ethylpentyl) phenol	665	Dinoterb acetate	334
Diethyl phthalate (ring-D4,98%)	664, 669, 676	N,N-Dimethylformamide (carbonyl-13C,99%)	677	Diocetyl maleate	485
Diethyl phthalate	332, 483, 664	2,4-Dimethylformanilide	333	Di-n-octyl phthalate (ring-D4,98%)	664, 677
Diethylstilbestrol (cis/trans mix) (ring-3,3',5,5'-diethyl-1,1',1'-D8,98%)	441, 661	Dimethyl hydrogen phosphate	333, 484, 701	Di-n-octyl phthalate	485, 664, 677
Diethylstilbestrol (cis/trans mix)	441, 661	1,3-Dimethyl-2-imidazolidinone (DMI) Headspace Grade	905	Diocetyl phthalate	485
Diethylstilbestrol	440, 441, 661	1,6-Dimethylnaphthalene (D12,98%)	650	Diocytlin dichloride	502
N,N-Diethyl-m-toluamide (DEET) (dimethyl-D6,98%)	329, 661, 689	1,6-Dimethylnaphthalene	652	Diofenolan	334
N,N-Diethyl-m-toluamide (DEET)	329, 661, 689	1,8-Dimethylnaphthalene (D12,98%)	650	Dioxacarb	334
Difenacoum	332	1,8-Dimethylnaphthalene	652	1,4-Dioxane HPLC Optigrade®	905
Difenoconazole	332	2,6-Dimethylnaphthalene (D12,98%)	650	1,4-Dioxane (p-Dioxane) (D8,98%)	677
Difenoxuron	332	2,6-Dimethylnaphthalene	652	1,4-Dioxane (D8,99%)	677
Difenoquat-methyl sulfate	332	1,3-Dimethyl-2-nitrobenzene	484, 722	1,4-Dioxane	485, 677
Diflovidazin	332	Dimethyl-p-nitrophenylphosphate	333	Dioxathion	334
Difloxacin-d3 hydrochloride	441	Dimethyl 5-nitro-iso-phthalate	333	Di-n-pentyl phthalate (ring-1,2-13C2,99%, dicarboxyl-13C2,99%)	664, 669
Difloxacin hydrochloride	441	alpha, alpha-Dimethylphenethylamine	484	Di-n-pentyl phthalate	664, 669
Diflubenzuron	332, 333	2,3-Dimethylphenol	333	Diphenamid	334
Diflufenican	333	2,4-Dimethylphenol (ring-D3,98%)	677	Diphenylamine (diphenyl-D10,98%)	677
Diflufenzopyr-sodium	333	2,4-Dimethylphenol	333, 484	Diphenylamine	334, 462, 485
1,4-Difluorobenzene	483, 756	2,5-Dimethylphenol	333	9,10-Diphenylanthracene	485
2,2'-Difluorobiphenyl	483, 761	2,6-Dimethylphenol	333	1,2-Diphenylethane	426
4,4'-Difluorobiphenyl	483, 738	3,4-Dimethylphenol	333	Diphenyl ether (13C12,99%)	637, 677
D-(+)-Digitoxose	284	3,5-Dimethylphenol	333	Diphenyl ether (D10,98%)	677
Diheptylin dichloride	502	Dimethyl phthalate (ring-D4,98%)	664, 677	Diphenyl ether	485
Di-n-hexyl phthalate (ring-1,2-13C2,99%, dicarboxyl-13C2,99%)	664, 669	Dimethyl phthalate	333, 334, 484, 664, 770	Diphenylether	638
Di-n-hexyl phthalate	664, 669	Dimethylsulfoxide Headspace Grade	905	5,5-Diphenylhydantoin (2-13C, 99%, 1,3-15N2, 98%)	441, 662
6,13-Dihydrodibenzo(b,i)phenazine	483	Dimethyl terephthalate	484	5,5-Diphenylhydantoin	441, 662
1,2-Dihydronaphthalene	483	Dimethyl tetraabromobisphenol A	639	1,2-Diphenylhydrazine (diphenyl-D10,98%)	677
beta-DL-3-(3,4-Dihydroxyphenyl)-alanine	289	Dimethyltin dichloride	334, 502	1,2-Diphenylhydrazine	485
Diiodomethane (13C,99%)	676	N,N'-Dimethylurea	334	Diphenylmercury	334
Di-Iodo-L-tyrosine dihydrate	289	Dimetilan	334	4,7-Diphenyl-1,10-phenanthroline	485
Diisobutyl phthalate	483	Dimetridazol-d3	441	Diphenyl phthalate	334, 485
Diisooctyl adipate	483	Dimoxystrobin	334	Diphenyl sulfide	334
2-(Diisopropylamino)ethanethiol	483	DIN 38407-F13	503	Diphenyl-sulfone	334

LGC Standards proficiency testing

LGC Standards is a major international provider of proficiency testing services. Operating from a dedicated site in the UK at Bury, Lancashire, the proficiency testing business encompasses over 6,000 participating laboratories in more than 130 countries across the world.

We offer an unprecedented breadth of schemes across a wide range of industries including: meat, dairy and other food sectors, water, soil and other environmental sectors, brewing, distilling, malting, sugar, forensic, consumer safety and pharmaceutical, most of which are run on an international basis.

Benefits of proficiency testing participation include:

- Monitor and improve quality of measurements
- Inter-laboratory measurement comparisons
- Greater process control
- Demonstrate competency to customers and accreditation bodies
- Staff development and training
- Evaluate methods and instrumentation
